The Main Component
The ultimate detail

- The main component is the lowest-level policy

- The dirties of all the dirty components

- The Main is located in the outermost circle of the clean architecture

- A plugin to the application

  - set up the initial conditions and configurations

  - gather all the outside resource

  - hand control over to the high-level policy of the application

Services: Great & Small

- Service architecture is not necessarily true, as it is simply one way of regrouping functions based on their behaviors

  - May not have the boundaries separating high-level policy from low-level detail with the Dependency Rule

- Service benefits?

  - The decoupling fallacy - shared resources like data

  - The fallacy of independent development and deployment - shared data/behaviors

- Cross-cutting concerns

  - Architectural boundaries don't fall between services, instead run through the services

  - Components within the services define the architectural boundaries of the system
